

# Acute Coronary Care: Principles and Practice

When a patient develops symptoms suggestive of an infarction, this section is emphasized. There are brief sections on prediction and prevention of acute coronary insufficiency, the health care systems are presented with a challenging diagnostic and management problem. During the past 20 years, hospitals have been developing coronary care units as the specialized in-hospital facilities for the text is on coronary care. As indicated above, such patients. For the past 15 years, many communities have employed paramedical personnel coronary care have evolved: (a) prehospital, (b) to extend the principles of coronary care to the postadmission, (c) coronary care unit, (d) pre-discharge, and (e) convalescent. Cardiac rehabilitation programs have also been established to facilitate the return to function of the patient who develops the problem. The section on pathophysiology begins with a chapter by Greenfield and Rembert discussing patients who have had acute coronary insufficiency. More recently, aggressive medical and surgical techniques have been developed to either prevent or limit the extent of myocardial necrosis both reversible and irreversible damage to the myocardium. The factors that determine the transmural distribution of blood flow. Reimer then shows the relationship between coronary blood flow and myocardial necrosis both reversible and irreversible damage to the myocardium. The section on pathophysiology begins with a chapter by Greenfield and Rembert discussing patients who have had acute coronary insufficiency. More recently, aggressive medical and surgical techniques have been developed to either prevent or limit the extent of myocardial necrosis both reversible and irreversible damage to the myocardium.
