

Management of Acromioclavicular Joint Injuries: Recent Trends

Acromioclavicular separations are one of the most common shoulder injuries seen in young athletes. They usually result as a direct blow to the shoulder. Several ligaments stabilize the clavicle to the scapula. The anterior, posterior, inferior, and superior acromioclavicular ligaments stabilize the clavicle to the acromion, with the superior ligament being most important. The coracoclavicular ligaments, the conoid and trapezoid, are strong ligaments which stabilize the clavicle to the coracoid process of the scapula. Separations are divided into 6 types (Rockwood, 1984), and treatment is decided upon on the basis of the type of separation.

Postoperative coracoid fracture after transcoracoid Abstract. Although recent advances have been made in the treatment of acromioclavicular (AC) joint injuries, they are still challenging for **Management of Acromioclavicular Joint Injuries - ResearchGate** Acromioclavicular joint separations account. for 9% to 41% of shoulder girdle injuries. 3,5. Changing. trends in management of these injuries have made the. **AC Joint and Clavicle Injuries Pediatric Orthopaedic Society of** Acromioclavicular (AC) joint injuries are more common than sternoclavicular (SC) . trend in recent literature is towards the initial non-operative management of **Acromioclavicular joint separations - NCBI - NIH** Although recent advances have been made in the treatment of acromioclavicular (AC) joint injuries, they are still challenging for shoulder surgeons.
