

Lectures on the comparative anatomy and physiology of the vertebrate animals Volume 1; delivered at the Royal College of Surgeons of England in 1844 and 1846

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1846 Excerpt: ...the external sphincter ani of Mammals is the reduced homologue of these muscles. In general homology they must be viewed as the lowest ventral strip of a single myocomma, more or less developed in accommodation to the varying distance between the last abdominal and first caudal, its proper, haemal arches, which variation relates to the office required to be performed by the ventral fins, or appendages of the last abdominal haemal arch, in the different species of fishes. The protractors of the pubic arch are attached, when present, to the apex of the coracoid arch. Transverse muscles extend from one pubic bone to the other; and similarly disposed special muscles serve to contract the span of the mandibular and hyoidean arches. The levators and depressors of the ventral fin are inserted, as in the pectorals, by as many fasciculi as there are digital rays. The deeper seated fibres of the segments, which together constitute the great lateral muscular masses of the trunk, alter slightly their direction, and, in the abdomen, represent the intercostals, passing from one vertebral rib to another, and from one aponeurotic representative of the sternal rib (inscriptio tendinea, lz, 11.) to another. The myocommata answering to the neural and haemal spines of the suppressed centres of the terminal caudal vertebrae, change their direction like those spines, slightly diverging from the axis of the trunk to be inserted into them: these modified terminal segments (z), by their connection with the interlocked myocommata of the great lateral masses, concentrate the chief force of those muscles upon the caudal fin. Special series of small dermal muscles are inserted into the rays of the dorsal, anal,

and caudal fins: the dorsal and anal rays have ...
