Not illustrated. 1766 Excerpt: ...working as the nature of the figure requires,-or.without decimals, the area may be had by multiplication of-feet and inches, but easiest of all by taking the dimensions by decimally.divided rules, and then the odd parts are ready reduced to hand, and is also truer than to take the dimensions in feet and inches &c. and to reduce the inches to decimal part-of a foot, for by such reduction often something remains, besides the inches are divided into more parts decimally, than among themselves, which is only into 8ths or half-quarters, so that, a foot contains 12 times 8 or 96 parts, but decimally divided it contains 100 parts, hence, when the area is required in feet, take the dimensions in feet and for the odds look not at the inches, but at the line on the edge of the sliding-rule decimally divided into a 100-parts in the length of a foot or 12 inches, so may you have your dimensions in feet and decimal parts of feet true, there are also yards taken as they are divided for the same end and for the like reason, Gunter's chain is divided into 100 links, &c. in most cases the content is required in inches/ feet, or yards, and being in any one of these it may be reduced to any other of them, by these three tables.
